
Operator MODI_OBSTACLE

1 Goal

Allows to recompute the profiles of obstacles in the systems guidance-tube after wearing.

The result concept of MODI_OBSTACLE is of `table_fonction` type. Its structure is similar to the product concept by DEFI_OBSTACLE with the DISCRETE keyword: parameters of wear (clearances, used surfaces, depth of wear...) are expressed on each sector (characterized by its polar coordinates) of the pencil or the guide. This form, called *figure of clearance*, is usable in operator DYNA_TRAN_MODAL under key key OBSTACLE.

MODI_OBSTACLE can be used either directly, by informing the parameters of wear, or to intervene following a computation of dynamics with DYNA_TRAN_MODAL: one initially calculates the volumes used with operator POST_USURE; TABL_USURE resulting from POST_USURE contains the volumes used during dynamic computation. MODI_OBSTACLE to compute: uses TABL_USURE the new figure of clearance after wearing.

The use of the empirically given models specific from feedback on the control rods currently limits the use of this option to the specific case of this component.

2 Syntax

```
figure1 = MODI_OBSTACLE [obstacle_sdaster]
(
    ◆GUIDE =guid , [obstacle_sdaster]
    ◇/CRAYON=crayon ,
[obstacle_sdaster]
    /R_MOBILE =rcray , [R]
    ◇OBSTACLE=figure0 ,
[obstacle_sdaster]
    ◇PERCEMENT=perce , [R]
    ◆/◆V_USUR_OBST=vusob , [1_R]
        ◆V_USUR_TUBE=vustu , [1_R]
        /◆ TABL_USURE=tabuse , [table_sdaster]
            ◇ INST =inst , [R]
            ◇ INFO=/1 , [DEFAULT]
        /2,
)
```

3 Operands

3.1 Operand GUIDE

◆GUIDE

compulsory keyword `GUIDE` makes it possible to define guidance used. This guidance is defined by `DEFI_OBSTACLE`.

It is of "DISCRETE" type or "`GUID_*_*_*`" if option `TABL_USURE` is not used. It is obligatorily of type "`GUID_*_*_*`" if option `TABL_USURE` is used (the removal of the preset forms of wear is valid only starting from the new antagonists).

"`GUID_*_*_*`" contains the type of card, the type of bearing, radius and the thickness of guidance. By default, it provides also the pencil adapted to the guide. "`GUID_*_*_*`" can take the values indicated exhaustively in the list below:

"GUID_A_CARTE_900"	"GUID_D_CARTE_900"	
"GUID_A_GCONT_900"	"GUID_D_GCONT_900"	
"GUID_A_GCOMB_900"	"GUID_D_GCOMB_900"	
"GUID_B_CARTE_900"	"GUID_E_CARTE_900"	
"GUID_B_GCONT_900"	"GUID_E_GCONT_900"	
"GUID_B_GCOMB_900"	"GUID_E_GCOMB_900"	
"GUID_C_CARTE_900"	"GUID_F_CARTE_900"	
"GUID_C_GCONT_900"	"GUID_F_GCONT_900"	
"GUID_C_GCOMB_900"	"GUID_F_GCOMB_900"	
"GUID_A_CARTE_1300"	"GUID_D_CARTE_1300"	"GUID_A_CAR11_1300"
"GUID_A_GCONT_1300"	"GUID_D_GCONT_1300"	"GUID_B_CAR11_1300"
"GUID_A_GCOMB_1300"	"GUID_D_GCOMB_1300"	"GUID_C_CAR11_1300"
"GUID_B_CARTE_1300"	"GUID_E_CARTE_1300"	"GUID_D_CAR11_1300"
"GUID_B_GCONT_1300"	"GUID_E_GCONT_1300"	"GUID_E_CAR11_1300"
"GUID_B_GCOMB_1300"	"GUID_E_GCOMB_1300"	"GUID_F_CAR11_1300"
"GUID_C_CARTE_1300"	"GUID_F_CARTE_1300"	
"GUID_C_GCONT_1300"	"GUID_F_GCONT_1300"	
"GUID_C_GCOMB_1300"	"GUID_F_GCOMB_1300"	

3.2 Operands CRAYON/R_MOBILE

Make it possible to define the mobile structure of which it is necessary to take account in the definition of the figure of clearance.

These operands are optional when one uses a guide "`GUID_*_*_*`", since by default the nature of pencil (900 or 1300MW) is implicitly given. Keywords "`CRAYON`" or "`R_MOBILE`" are exclusive L" one of the other.

Operand `CRAYON` makes it possible to define a figure of clearance resulting from `DEFI_OBSTACLE`. It is of "DISCRETE" type, "`CRAYON_900`" or "`CRAYON_1300`" if option `TABL_USURE` is not used. It is obligatorily of type "`CRAYON_900`" or "`CRAYON_1300`" if option `TABL_USURE` is used, because the removal of the preset forms of wear is valid only from new antagonists (see §3.6).

Operand `R_MOBILE` makes it possible to define a pencil of constant radius `rcray` (value in meter).

3.3 Operand OBSTACLE

optional keyword `OBSTACLE` makes it possible to introduce the initial figure of clearance `figure0` from which one calculates the obstacle result `figure1`.

If `figure1 = MODI_OBSTACLE (reuse = figure1)`, the obstacle `figure1` is modified in output of `MODI_OBSTACLE`.

3.4 Operand PERCEMENT

optional keyword `PERCEMENT` applies to the tube. It makes it possible to give the ratio thickness used on initial thickness which sets off an alarm. The release of alarm corresponds to a boring of the tube.

3.5 Operands V_USUR_OBST and V_USUR_TUBE

keywords `V_USUR_OBST` and `V_USUR_TUBE` make it possible to the user to give volumes used to apply respectively to the obstacle and the tube. `vusob` and `vustu` are lists of volumes used by angular sector. They have same structure as the lists of worn volumes resulting from `POST_USURE`.

These key keys are used only to carry out computations of test using `MODI_OBSTACLE`. During the use of `MODI_OBSTACLE` following a dynamic computation, one more often uses `TABL_USURE`.

3.6 Operands TABL_USURE and INST

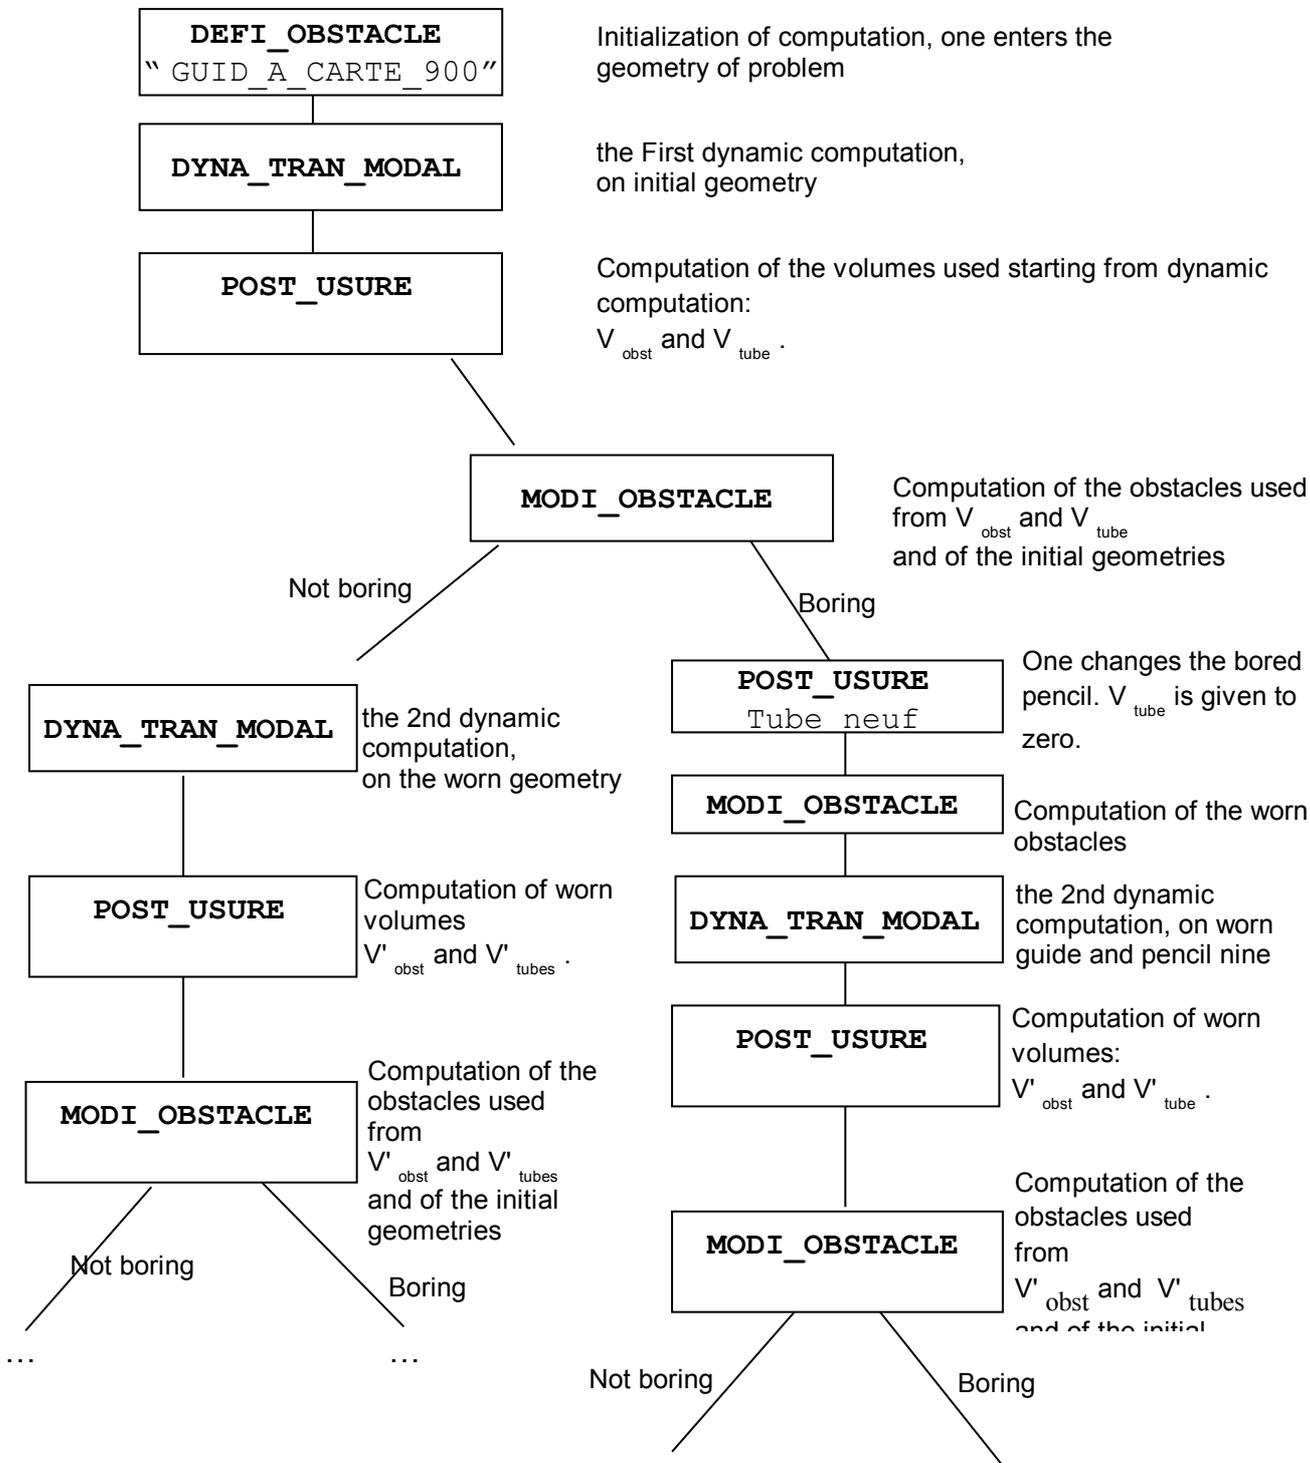

`tabuse` is an array of wear defined by `POST_USURE`. It contains the volumes used on the guide and the pencil by angular sectors and for various dates. `MODI_OBSTACLE` reads the volumes used at time `INST` and applies these volumes to the guide and the pencil according to precise profiles. These profiles result from feedback.

These rules are valid only from new obstacles, i.e. the guide and the pencil used must be respectively defined by `"GUID_*_*_*"` and `"CRAYON_*"` in `DEFI_OBSTACLE`.

In the case of the use of the option `INST` of `TABL_USURE` several times of continuation, it is necessary to take care of well controlling the dates and cumulated times preserved in array `TABL_USURE`.

4 Example of use

an example of use is the vibratory computation of a cluster in a guide of cluster.
The approach indicated is then followed [Figure 4-a].

Appear 4-a: Example of computation using MODI_OBSTACLE
