

ZZZZ253 – Mechanical nonlinear calculation with change of grid

Summary:

This test does not have any physical meaning, it is primarily a data-processing test.

Modeling a:

In this modeling one wishes to check the possibility of carrying out a mechanical calculation by beginning it on a grid and by finishing it on another.

The results of reference are given by same calculation makes only on the first grid like only on the second grid.

The change of grid is done using the order `PROJ_CHAMP` with the method `COLLOCATION`.

This documentation is voluntarily brief.
