

SSNS109 – Beam comforts subjected to a shearing action

Summary:

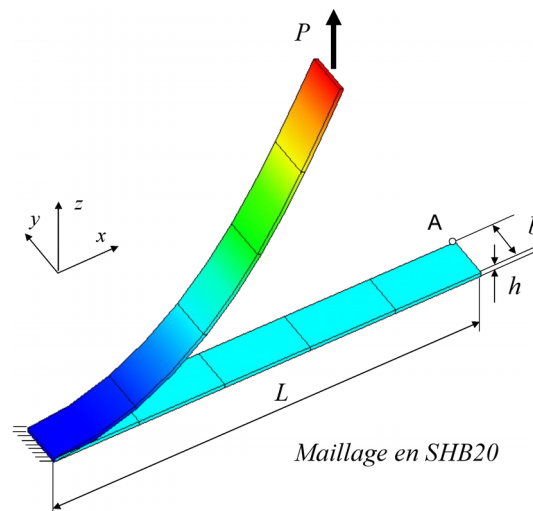

This test of nonlinear quasi-static mechanics makes it possible to validate the elements SHB into nonlinear geometrical.

Four modelings make it possible to study various configurations:

- modeling A with D: linear elastic behavior, great displacements, test on all the elements SHB (SHB8, SHB6, SHB20, SHB15)

1 Problem of reference

1.1 Geometry

Geometry, loading and displacement of the beam comfort into non-linear geometrical and great displacement, example of a grid of 5 elements SHB20

- Dimensions of the beam:
 - $L = 10\text{m}$
 - $b = 1$
 - Thickness $h = 0.1\text{m}$

1.2 Properties of material

The fixed characteristics are the following ones:

Elastic characteristics:

$$E = 1.2 \times 10^6 \text{ Pa}$$

$$NU = 0$$

1.3 Boundary conditions and loadings

The beam is embedded at an end. The other end is free and a concentrated force is applied P according to the direction Z . This force is applied incrementalement of 0 to P_{max} :

$$P_0 = \frac{EI}{L^2} = 1 \text{ N} \text{ and } P_{max} = 4 P_0$$

The loading is controlled by the value of following displacement Z point A . The amplitude of the force (coefficient ETA by piloting) is increased so that displacement grows until 6.7mm by step of 0.1mm .

2 Reference solution

2.1 Method of calculating

Digital solution [bib1]: values of the parameter of piloting (thus of the force P) according to the time (thus of displacement U_z point A).

2.2 Sizes and results of reference

Coefficient of piloting (Multiplying coefficient of the force applied) according to displacement U_z point A .

Results of reference got by a modeling in 16x1x1 elements hull $S4R$ of Abaqus.

3 Modeling A

3.1 Characteristics of modeling

Embedding of an end. Linear elasticity in great displacements.

3.2 Characteristics of the grid

Many nodes: 126

Many meshes and types: 40 HEXA8 .

3.3 Sizes tested and results

Identified parameters: coefficient of piloting (force applied), displacement in x and z point A :

6 Modeling D

6.1 Characteristics of modeling

Embedding of an end. Linear elasticity in great displacements.

6.2 Characteristics of the grid

Many nodes: 218
Many meshes and types: 30 PENTA15.

6.3 Sizes tested and results of modeling D

Identified parameters: coefficient of piloting (force applied), displacement in x and z point A :

Reference			% difference	
P/P_{max}	$-U_x(m)$	$U_z(m)$	$-U_x(m)$	P/P_{max}

7 Summary of the results

Results got by *Code_Aster* with modeling SHB show the capacity of all the elements of this modeling to deal with problems with nongeometrical linearities.
