

SSNV179 - Cubic under creep via the law LEMA_SEUIL

Summary:

The purpose of this test is to validate the law `LEMA_SEUIL` derived from the law from `LEMAITRE` classic. In particular, we will be delayed on the activation of the specific threshold to this law. One thus carries out a creep test on a geometry simple to know a cube here.

A modeling 3D with elements `HEXA8` is currently available.

1 Problem of reference

1.1 Geometry

Coordinates of the points:

<i>A</i>	<i>B</i>	<i>C</i>	<i>D</i>	<i>E</i>	<i>F</i>	<i>G</i>	<i>H</i>
0.	1.	1.	0.	0.	1.	1.	0.
0.	0.	1.	1.	0.	0.	1.	1.
0.	0.	0.	0.	-1.	-1.	-1.	-1.

1.2 Material properties

Elastic properties:

$$E = 165000 \text{ MPa}$$

$$\nu = 0.3$$

Viscous properties:

Law of LEMA_SEUIL

$$A = 14.143 \cdot 10^{-13} \text{ MPa}^{-1} \cdot \text{neutron}^{-1}$$

$$S = 0.0788 \cdot 10^{10} \text{ MPa}^{-1} \cdot \text{s}^{-1}$$

1.3 Boundary conditions and loadings

Surface force:

$$F = 220 \text{ MPa}$$

Irradiation:

$$\text{Flow of irradiation: } 1.85 \cdot 10^{15} \text{ neutrons} \cdot \text{cm}^2 \cdot \text{s}^{-1}$$

Imposed displacements:

$$\text{Node } A : DX = DY = DZ = 0.$$

$$\text{Node } E : DX = DY = 0.$$

$$\text{Node } D \text{ and node } H : DX = 0.$$

On the first increment of time the force passes from 0 with its maximum value 220 MPa linearly compared to time for then being maintained constant over all the duration of the experiment.

2 Reference solution

2.1 Method of calculating used for the reference solution

The goal of the reference solution is analytically to calculate the value of the threshold from which creep appears.

Some results of nonregression on displacements with the last step of time are added to check the total rigidity of the system.

For the analytical calculation of the threshold one a:

As long as the structure remains elastic and because of the boundary conditions, the tensor of the constraints is written:

For the first step of time understood enters 0 and 106 s

$\sigma_{xx}(t) = 2.2 \cdot 10^{-4} t$, T in second and σ_{xx} in MPa. The other components of the tensor are worthless.

For the others not of time, $\sigma_{xx} = 220 \text{ MPa}$

However one a:

$$D = \frac{1}{S} \int_0^t \sigma_{eq}(u) du$$

Maybe as in this case $\sigma_{eq} = \sigma_{xx}$, one obtains in an immediate way while solving $D=1$ the value of the time from which creep is declared: $t_1 = 4.0818181810^6 \text{ s}$

Thus for a time equal to t_1 , the viscous deformations are worthless and $D=1$ is worth.

2.2 Results of reference

Internal variable $V1$ and $V2$ at the point A , B , C and E as well as the displacement of the point B with the last step of time

3 Modeling A

3.1 Characteristics of modeling

Elements 3D (HEXA8)

Only one element was modelled to represent the cube

Along the axis Z : 1 layer of elements
Total thickness: 1

Limiting conditions:

Node A $DX = DY = DZ = 0.$
Node E $DX = DY = 0.$
Node D $DX = 0.$
Node H $DX = 0.$

pressure on the face $F = 220. MPa$
 $BCFG$

3.2 Characteristics of the grid

Many nodes: 8
Many meshes and types: 1 HEXA8 and 1 QUAD4 (faces external skin).

3.3 Sizes tested and results

Localization	Size	Reference	Aster	% difference
<i>A</i>	<i>V1</i>	0.00000000	0.00000000	0%
	<i>V2</i>	1.00000000	9.9999999949239 10 ⁻⁰¹	-5.08 10 ⁻⁸ %
<i>B</i>	<i>V1</i>	0.00000000	0.00000000	0%
	<i>V2</i>	1.00000000	9.9999999949239 10 ⁻⁰¹	-5.08 10 ⁻⁸ %
	<i>DX</i>	/	7.8380536694423 10 ⁻²	/
	<i>DY</i>	/	1.2984914071992 10 ⁻¹⁶	/
	<i>DZ</i>	/	1.2984914071992 10 ⁻¹⁶	/
<i>C</i>	<i>V1</i>	0.00000000	0.00000000	0%
	<i>V2</i>	1.00000000	9.9999999949239 10 ⁻⁰¹	-5.08 10 ⁻⁸ %
<i>E</i>	<i>V1</i>	0.00000000	0.00000000	0%
	<i>V2</i>	1.00000000	9.9999999949239 10 ⁻⁰¹	-5.08 10 ⁻⁸ %

4 Summary of the results

The objective of this case test is completely filled since the activation of creep via the detection of the threshold is very precise (about $10^{-8}\%$ of error). Of course, since it is about viscous phenomenon, the discretization in time plays a very important part in particular in the surrounding of the activation of the threshold. In this case test a very particular care was taken to surround time when the threshold is reached in a precise way to get satisfactory results.
