
Note of receipt of Salome_meca

Summary:

This documentation describes the method to carry out the receipt of an installation of salome_meca on a local station. It can be a question of the diffused version in-house EDF or version LGPL diffused into external. One described there more precisely the launching of the tests provided with the versions of *code_aster* embarked and of the tests of the various tools of the platform salome_meca.

This document aims at:

- to formalize a approach of receipt of the platform salome_meca,
- to allow a Research department to check according to the same criteria as EDF the good installation of a version of salome_meca,
- to allow the EDF client to control the good performance of a version installed locally at a person receiving benefits if it were used for final calculations.

1 Launching of the tests associated with the solvor code_aster

It is necessary to have proceeded to the installation of the platform salome_meca by using the instructions available on the site www.code-aster.org after having downloaded the ad hoc version.

The procedure of receipt described below was validated for the versions of Salome_meca starting from the version 2018. It is a question of starting the tests embarked in (them) the version (S) of the solvor Code_hasster embarked (be).

Salomé integrates a script allowing to start tests. This script perhaps used automatically to launch the whole of the base of tests delivered and to carry out an assessment which it is easy to compare with that appearing in the card quality of the version of exploitation (A0 booklet of handbook A of documentation Code_hasster). Possible variations compared to the list of the tests mentioned as stopping in error must be announced to the team project R & D so that she decides.

The order which makes it possible to launch the procedure of receipt is for example:

```
Salome test - L ASTER_VERIFICATION_SEQUENTIAL - R ASTER_XX
```

The number tests started into simultaneous (8 in the example) must be adapted to the platform used and the number of hearts available, and **ASTER_XX** must be adapted to the version tested (for example **ASTER_14** to isolate the tests from the version 14).

Note:

If the tests are carried out on distant machine, it is necessary to activate the "display access control", it is thus necessary to use the option - **X** or **there** at the time of connection HS to the machine tested:

```
HS - X machine_cible
```

At the end of the execution the assessment is displayed in the terminal:

```
3360/3362 Test #7687: ASTER_14.4.0_zzzz367a ..... Passed 17.67 dryness
3361/3362 Test #7681: ASTER_14.4.0_zzzz364a ..... Passed 68.67 dryness
3362/3362 Test #7623: ASTER_14.4.0_zzzz337b ..... Passed 146.09 dryness
```

Assessment aster 14.4 in salome_meca 2019.0.1

```
99% tests passed, 11 tests failed out of 3694
```

```
Label Time Summary:
ASTER_14.4.0                = 116067.30 sec*proc (3694 tests)
ASTER_VERIFICATION_SEQUENTIAL = 116067.30 sec*proc (3694 tests)
SMECA_INTEGR                = 201.06 sec*proc (8 tests)
```

```
Total Test time (real) = 14623.85 dryness
```

The following tests FAILED:

```
1372 - ASTER_14.4.0_rtool01e (Failed)
1479 - ASTER_14.4.0_sdll123d (Failed)
1730 - ASTER_14.4.0_sdlx104a (Failed)
1846 - ASTER_14.4.0_sdnv105c (Failed)
1851 - ASTER_14.4.0_sdnv108a (Failed)
2696 - ASTER_14.4.0_ssnl133e (Failed)
3569 - ASTER_14.4.0_ssnv250e (Failed)
3599 - ASTER_14.4.0_ssnv256a (Failed)
4231 - ASTER_14.4.0_zzzz151a (Failed) ok, code incorrect return but without error
Errors while running CTest
```

It is then necessary to compare the result of the passage of the tests with the card quality of the associated version (cf. for example [A0.03.40] "Card Quality of the version of exploitation of Code_hasster : version 14").

For the tests in variations, it is necessary to start again test by using the following order:

```
Salome test - R ASTER_YY.Y.Y_xxxx - V
```

with **YY.Y.Y** the version of *Code_hasster* considered and **xxxx** the name of the test, for example:

```
Salome test - R ASTER_14.4.0_zzzz151has -V
```

and to make follow the log to the team project R & D so that she comes to a conclusion about the gravity of the variation.

2 CAS-tests of graphic validation of the platform Salome_meca

There does not exist for the time being automatic procedure of launching of the CAS-tests of graphic validation of salome_meca. The procedure consists in testing the installation manually while following the instructions of the handbooks contained in booklets SV1, SV2 and SV3 of documentation salome_meca.

3 Launching of the associated tests with the platform salome_meca

It is possible to start the tests of the various tools of the platform salome_meca by using the following order:

```
./salome test - L SMECA
```

This order will start the tests provided for the various software embarked specifically for the platform, of which a limited selection of the tests of the versions of the solver *code_aster*. It produces for example for the version the 2017 following exit:

```
Test project /home/I27518/salome_meca/appli_V2017/bin/salome/test
  Start 829: EDYOS_edynos.tests.unittest_entity_form.ComplexEntityFormTC

Errors while running CTest
```

4 Skirting for execution without right of writing

During the launching of the tests with `Salome test`, the results are written in the repertoire `appli_XXX/bin/salome/test/`.

If the installation is made per package or another reason which makes that one cannot write in the repertoire quoted above, one can apply the following procedure.

In this example, one creates the virtual application in `/local00/tmp/appli` (to replace the suspension points by the original repertoire of installation):

```
... /V2019_calibre_9/create_appli.sh - D - has /local00/tmp/appli
Cd /local00/tmp/appli
CP... /application_V2019_calibre_9/env.d/envLocal.cfg env.d/
./salome test...
```
